

# DESIGN FEEDBACK

Design suggestions provided by users during initial usability testing

## Record Keeping System

- Consider creating a companion application for tech-savvy users.
- Keep a digital record of when pills are being taken so that doctors can check on adherence rates before altering medication regimens.
- Don't have too many pages or information will become disorganized.
- Use big spaces with eye catching (colorful) labels.
- Include pictures or icons to minimize time spent reading.

## Medication Organization System

- Have a way to find the medi-set (and record book) if it gets lost.
- Make batteries last as long as possible and have an indicator light if they run low.
- Include positive reinforcement (a pill box that says "thank you" when pills are taken).
- Have a way to indicate when refills are needed.
- Have a way to quickly and easily connect with a care manager for medication instructions.

## Reminder System

- Utilize stepped feedback (notifications get louder and more frequent).
- Add optional audio feedback.
- Add a feature that allows caretakers to record their voice to help calm users with Alzheimer's.
- Enable text message notifications (landline calls for the elderly).
- Consider integrating claiming family photos in the background.
